

Does varying preparatory delay interval affect the sensory discrimination performance in the antisaccade task?

PDI impact on attention

1. Tables coming from R

Cits ? and also (?) Tables and Figure 1 can also be generated using R chunks, as shown in example.

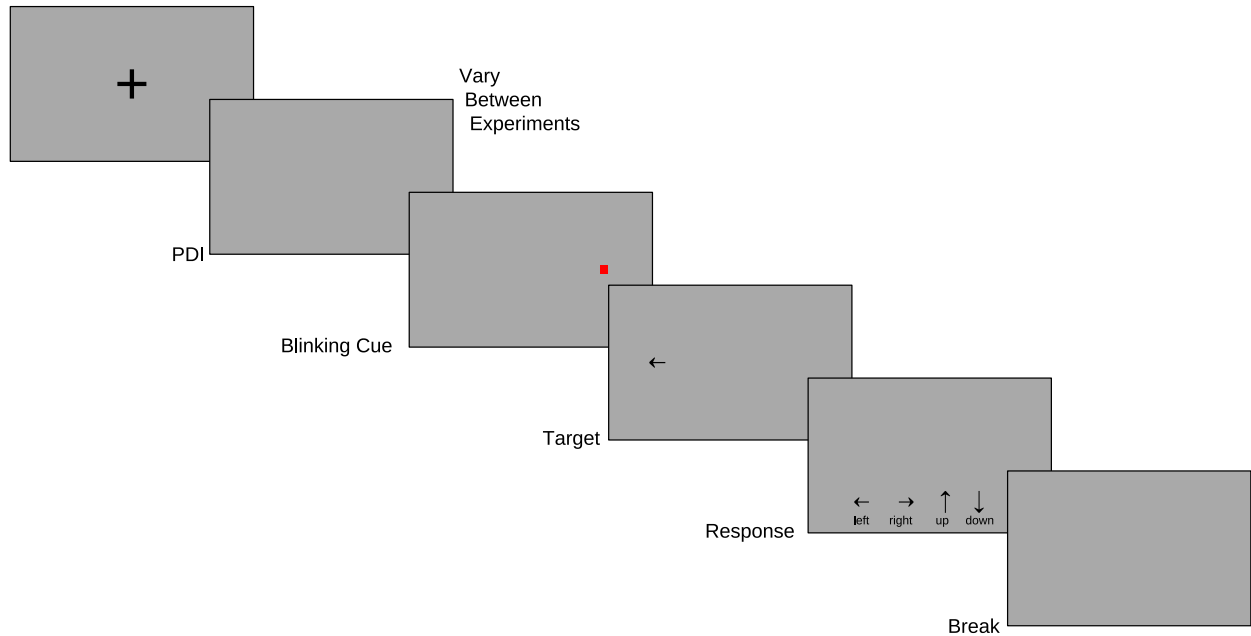

Figure 1: The structure and timing of an antisaccade trial. The cues were radial line segments at a certain angle relative to fixation. The targets were either X or M, and in the antisaccade trial, appeared opposite from the cue. The duration of the target was staircase adjusted, and the target was followed by a sequence of two masking displays. This sequence was highly effective and induced little response bias toward either target. Prosaccade trials were the same with the exception that the cue and target appeared at the same angle relative to fixation.

and some text and some more citation (?).
